

## Project Questions

1) Can you think 5 more rules (other than the one explicitly described above) that are likely to be used in a company.

- a) Employee Performance Reviews: Each employee might have periodic performance reviews that are conducted by their supervisor. These reviews could include ratings in various categories and overall feedback.
- b) Product Inventory: There might be a need to track the inventory levels of each product. This could involve rules for when to reorder products, minimum inventory levels, etc.
- c) Customer Orders: Customers might place orders for products. These orders could have rules around shipping, payment, order fulfillment, etc.
- d) Employee Benefits: The company might offer various benefits to employees, such as health insurance, retirement plans, etc. There could be rules around eligibility for these benefits.
- e) Customer purchase-info: customer should have a subclass like employee has (salary). Which can used to keep track of the customer's purchase history (purchase id, purchase\_type, payment\_info, etc)

2) Is the ability to model super-class/subclass relationships likely to be important in such environment? Why or why not?

The ability to model super-class/subclass relationships is indeed important in such an environment.

This is because it allows for the representation of 'is-a' relationships, which are common in real-world scenarios.

For example, in the context of this project, an Employee, a Customer, and a Potential Employee are all types of People.

By modeling this as a super-class (People) / subclass (Employee, Customer, Potential Employee) relationship, we can avoid redundancy and maintain consistency in the database.

It also allows for easier querying and data manipulation.

3) Justify using a Relational DBMS like Oracle for this project.

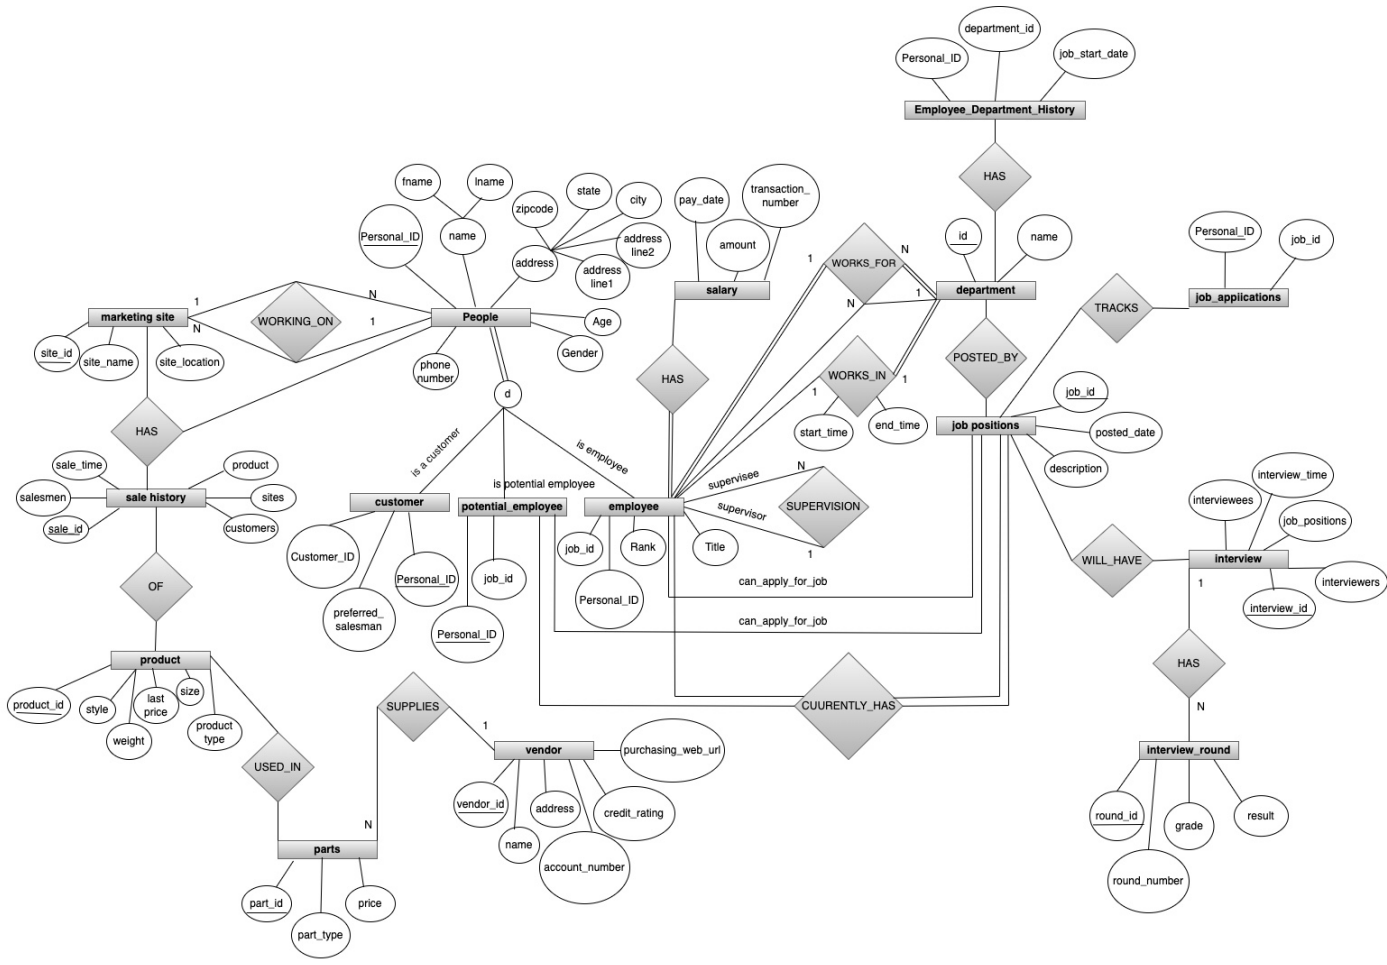

Using a Relational DBMS like Oracle for this project would be beneficial for several reasons:

- a) Structured Data: Oracle is excellent at handling structured data, which is what we have in this scenario. The data can be easily organized into tables, making it easy to manage and query.
- b) ACID Properties: Oracle ensures Atomicity, Consistency, Isolation, and Durability (ACID) of transactions, which is crucial for maintaining data integrity in a business environment.
- c) Scalability: Oracle can handle large volumes of data and many concurrent users, making it suitable for a company setting.
- d) Security: Oracle provides robust security features, including access control, data encryption, and auditing capabilities.
- e) Advanced Features: Oracle supports advanced features such as stored procedures, triggers, and views, which can be useful for implementing complex business logic.

Project Exercises

I. Draw an EER to accurately represent this set of requirements. This will be your Conceptual Design. Clearly specify any assumption that you are making. You can use any tools (software) to draw the EER. You don't need describe the value constraints of the attributions in the EER diagram. (25%)

EER

# Assumption  
we can have a junctions table name "sales" to connect two tables - "employee" with "products"

**a) Convert your Conceptual model to a Logical model that can be implemented in a relational DBMS like Oracle. During this process you replace M-N relationships and multi-valued attributes with constructs that can be implemented in the relational DBMS. Draw EER for the logical model after your modifications. Feel free to change your conceptual model (first delivery) if needed.**

            string end_time
            string job_id FK
        }

        Interview_round {
            string round_id PK
            string grade
            string result
            string round_number
            string interview_id FK
        }

        job_applications {
            string personal_id FK
            string job_id FK
        }

        Employee_Department_History {
            string personal_id FK
            string department_id FK
            string job_start_date
        }

        Sales {
            string sales_id PK
            string employee_id FK
            string product_id FK
        }
  
```

b) Convert the EER to a database design. Document your design in Database Schema format like the one we discussed in the class.

### III. Use appropriate naming conventions for all your tables and attributes. (40%)

a) Normalize all your tables to third normal form. Make any necessary changes to the EER. Explain why these changes needed to be made.

One of my entity "Interview" was not in 3NF (Third Normal Form) because it had transitive dependencies. In this case, the attributes interviewees\_name, interviewees\_email\_address, interviewees\_phone\_number, and interviewers\_name were dependent on interviewees\_id and interviewers\_id, which are non-prime attributes (not part of the primary key).

To normalize this table into 3NF, I removed these transitive dependencies. I did this by creating separate tables for Interviewees and Interviewers where their id is the primary key and their other attributes are dependent on this primary key.

b) Draw a dependency diagram for each table.

interviewees

<u>interviewees_id</u>	interviewees_name	interviewees_email_address	interviewees_phone_number
------------------------	-------------------	----------------------------	---------------------------

Interviewers

<u>interviewers_id</u>	interviewers_name
------------------------	-------------------

Interview

<u>interview_id</u>	interviewees_id	interview_time	job_id	interviewers_id
---------------------	-----------------	----------------	--------	-----------------

Department

<u>department_id</u>	department_name
----------------------	-----------------

people

<u>personal_id</u>	lname	fname	phone_number	zipcode	state	city	address_line_1	age	gender
--------------------	-------	-------	--------------	---------	-------	------	----------------	-----	--------

customers

<u>personal_id</u>	preferred_salesman
--------------------	--------------------

potential\_employee

<u>personal_id</u>	job_id
--------------------	--------

employee

<u>personal_id</u>	job_id	supervisor_id	department_id	salary_id
--------------------	--------	---------------	---------------	-----------

job\_positions

<u>job_id</u>	posted_date	description	department_id
---------------	-------------	-------------	---------------

vendor

<u>vendor_id</u>	vendor_name	address	account_number	credit_rating	purchasing_web_url
------------------	-------------	---------	----------------	---------------	--------------------

parts

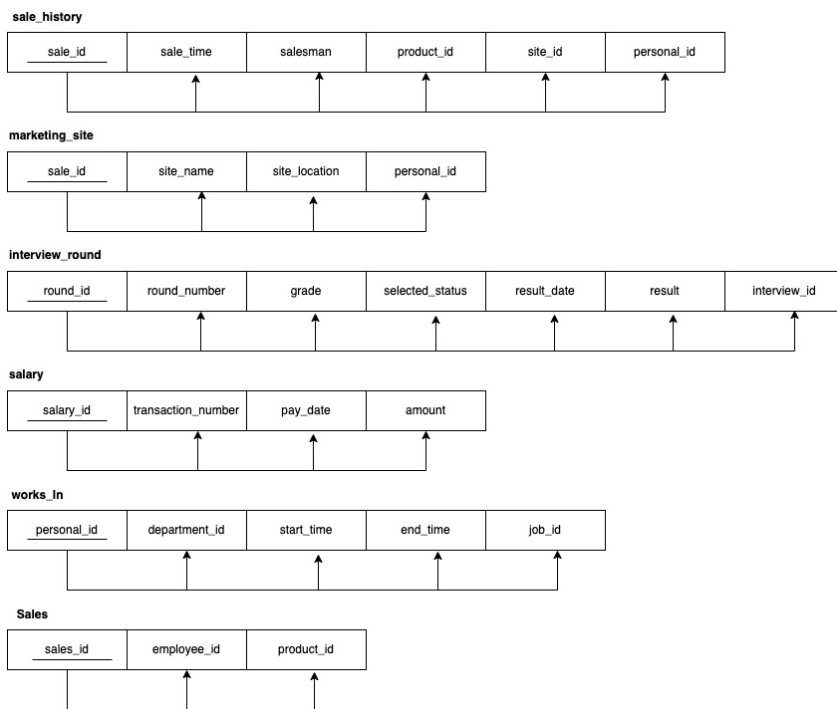

<u>part_id</u>	part_type	price
----------------	-----------	-------

products

<u>product_id</u>	style	weight	price	size	product_type	product_status	product_cost	part_id
-------------------	-------	--------	-------	------	--------------	----------------	--------------	---------

3NF

3NF

c) Write SQL statements to create database, tables, and all other structures.

Primary keys and foreign keys must be defined appropriately.

The quantity constraints of the relation between the entities, which should be described in EER diagram, are not required.

```
CREATE TABLE people (
  personal_id INT PRIMARY KEY,
  lname VARCHAR(50),
  fname VARCHAR(50),
  phone_number VARCHAR(50),
  zipcode VARCHAR(5),
  state CHAR(2),
  city VARCHAR(50),
  address_line_1 VARCHAR(40),
  age INT,
  gender CHAR(1)
);
```

```
CREATE TABLE Department (
  department_id INT PRIMARY KEY,
  department_name VARCHAR(20)
);
```

```
CREATE TABLE customers (
  personal_id INT PRIMARY KEY,
  preferred_salesman INT,
  FOREIGN KEY (personal_id) REFERENCES people(personal_id),
  FOREIGN KEY (preferred_salesman) REFERENCES employee(Personal_id)
);
```

```
CREATE TABLE potential_employee (
  personal_id INT PRIMARY KEY,

```

**d) Use the Create View statement to create the following views:**

*# View1: This view returns the average salary each employee has earned from the company monthly after she/he becomes an employee in the company.*

```
CREATE VIEW View1 AS  
SELECT e.personal_id, ROUND(AVG(s.amount)/12, 2) AS average_monthly_salary  
FROM Employee e  
JOIN Salary s ON e.salary_id = s.salary_id  
GROUP BY e.personal_id;
```

personal_id	average_monthly_salary
1	4166.67
2	6666.67
3	9166.67
8	9166.67
9	9166.67
10	9166.67
11	9166.67
4	5416.67
5	5833.33

*# View2: This view returns the number of interviews rounds each interviewee pass for each job position.*

```
CREATE VIEW View2 AS  
SELECT i.interviewees_id, i.interviewees_name, jp.job_id, COUNT(ir.round_id) AS passed_rounds  
FROM Interview i  
LEFT JOIN Interview_round ir ON i.interview_id = ir.interview_id  
LEFT JOIN Job_positions jp ON i.job_id = jp.job_id  
WHERE ir.selected_status = 'YES'  
GROUP BY i.interviewees_id, i.interviewees_name, jp.job_id;
```

interviewees_id	interviewees_name	job_id	passed_rounds
5	Hellen Cole	11111	1
3	Jim Williams	33333	1
2	Jane Johnson	44444	1
5	Hellen Cole	12345	1
5	Hellen Cole	33333	1
5	Hellen Cole	44444	1

3	Jim Williams	44444	1
3	Jim Williams	55555	1

# View3: This view returns the number of items of each product type sold.

```
CREATE VIEW View3 AS
SELECT p.product_type, COUNT(sh.sale_id) AS items_sold
FROM Products p
JOIN Sale_history sh ON p.product_id = sh.product_id
WHERE p.product_status = 'Sold'
GROUP BY p.product_type;
```

product_type	items_sold
cup	4

# View4: This view returns the part purchase cost for each product.

```
CREATE VIEW View4 AS
SELECT p.product_id, SUM(pt.price) AS part_cost
FROM Products p
JOIN Parts pt ON p.part_id = pt.part_id
GROUP BY p.product_id;
```

product_id	part_cost
1	100.00
5	100.00
6	100.00
2	200.00
3	400.00
4	900.00

e) Answer the following Queries. Feel free to use any of the views that you created in part (d).

1) Return the ID and Name of interviewers who participate in interviews where the interviewee’s name is “Hellen Cole” arranged for job “11111”.

interviewer_id	interviewer_name
1	John Smith

2) Return the ID of all jobs which are posted by department “Marketing” in January 2011.

job_id
12345
77777
NULL

3) Return the ID and Name of the employees having no supervisees.

personal_id	fname	lname
1	John	Smith
8	Jim	Williams

4) Return the Id and Location of the marketing sites which have no sale records during March, 2011.

site_id	site_location
1	Location 1
2	Location 2
NULL	NULL

5) Return the job’s id and description which does not hire a suitable person one month after it is posted.

job_id	description
55555	IT Support

6) Return the ID and Name of the salesmen who have sold all product type whose price is above \$200.

Salesman_ID	Salesman_Name
3	Jim Williams
4	June Jones

7) Return the department’s id and name which has no job post during 1/1/2011 and 2/1/2011.

department_id	department_name
2	Sales
3	HR
4	Finance
5	IT
NULL	NULL

8) Return the ID, Name, and Department ID of the existing employees who apply job “12345”.

personal_id	fname	lname	department_id
1	John	Smith	2
2	Jane	Johnson	1
3	Jim	Williams	3

9) Return the best seller’s type in the company (sold the most items).

salesman	items_sold
John Smith	3

10) Return the product type whose net profit is highest in the company (money earned minus the part cost).

product_id	product_type	net_profit
6	Product Type 6	599.00

11) Return the name and id of the employees who has worked in all departments after hired by the company.

Employee_Name	Number_Of_Departments_Worked
Jim	5

12) Return the name and email address of the interviewee who is selected.

interviewees_name	interviewees_email_address	selected_status
Hellen Cole	hellen.cole@example.com	YES
Jim Williams	jim.williams@example.com	YES
Jane Johnson	jane.johnson@example.com	YES

13) Retrieve the name, phone number, email address of the interviewees selected for all the jobs they apply.

interviewees_name	interviewees_phone_number	interviewees_email_address	Number_of_Departments_Applied	Number_of_Departments_Selected
Jim Williams	1122334455	jim.williams@example.com	5	5
Hellen Cole	3344556677	hellen.cole@example.com	5	5

14) Return the employee’s name and id whose average monthly salary is highest in the company.

Employee_Name	Average_Monthly_Salary
Jim	9166.666667

15) Return the ID and Name of the vendor who supply part whose name is “Cup” and weight is smaller than 4 pound and the price is lowest among all vendors.

Vendor_ID	Vendor_Name	Product_Type	Lowest_Price
1	Vendor 1	cup	100.00
